PreOpsis

FOR HOSPITALS

PRE-OPERATIVE ASSESSMENT AND RECOVERY

Pre-operative screening that starts at home.

Patients complete their health questionnaire on their own phone. Your pre-op team sees at once who is ready for surgery and who needs extra attention. After the operation you follow the same patient's recovery, in the same system.

Fewer visits to the pre-op clinic

Low-risk patients are screened digitally. A clinic appointment is kept for those who need it.

Complete and ready for theatre on time

SMS and email reminders and a worklist of non-responders, so no operation is held up by a missing screening.

Time for the right patient

Your team validates instead of re-typing, and spends its time on patients at higher risk.

From referral to recovery in one system

1 Questionnaire at home

2 Automatic triage

3 Validation by the pre-op team

4 Recovery and PROMs

THE CHALLENGE

An incomplete screening costs a slot in the theatre schedule.

Pressure on the pre-op clinic

Fewer nurses and anaesthetists for the same number of operations, or more.

Waiting lists

Every theatre slot counts. A screening that is incomplete at the last minute means a moved or empty slot.

Re-typing and chasing

Answers are copied into the EHR and missing details are chased by phone.

Language and literacy

Not every patient reads Dutch easily. A questionnaire has to be clear to everyone.

HOW IT WORKS

One route, from request to recovery

1. **Invitation from the EHR**
   As soon as the operation is requested, the patient receives an SMS and email with a personal link.
2. **Questionnaire at home**
   On their own phone, with no app or password: open the link, enter their date of birth and start. Answers save automatically and reminders follow on their own.
3. **Automatic triage**
   From the answers, PreOpsis suggests an ASA grade and risk scores. Low-risk patients with no flags move to 'Ready for admission'. Others get a phone or clinic consultation. Every outcome is visible and can be reversed.

ASA I–II	ASA III–IV
Completed digitally	Consultation

   Rules set by each hospital
4. **Validation by the pre-op team**
   The nurse or anaesthetist reviews each section, corrects where needed and always sees what the patient answered.
5. **Pre-op summary back in the EHR**
   The summary with coded findings (SNOMED CT, ICD-10) is ready for the anaesthetist and the theatre team.
6. **Recovery at home**
   After discharge the patient answers recovery questions and PROMs on the same phone. Your team sees who is falling behind.

PreOpsis works alongside your EHR

The EHR stays the source of truth. PreOpsis takes the patient and the request, handles contact with the patient and returns the result.

WHAT YOU GET

Built for the whole pre-op process

Pre-op summary · Validation — J. Jansen (example) · Total knee replacement

Validated summary | Patient answers

QUESTION	PATIENT	VALIDATED	
Blood thinners	Yes, warfarin	Yes, warfarin 3 mg	`Anticoagulation · ICD-10 Z92.1`
Snoring and pauses in breathing	Yes	Yes	`STOP-Bang 3 · intermediate risk`
Height and weight	1.78 m · 92 kg	1.78 m · 92 kg	`BMI 29.0`
Previous anaesthetic	Felt sick after surgery	PONV after general anaesthesia	`Apfel 2`

Suggested ASA

ASA II

1 amber flag · 4 findings

Complete validation

Pre-op team and anaesthetist

- Validation per section, with the patient's own answers alongside
- Suggested ASA grade and risk scores such as STOP-Bang and Apfel
- Findings with codes, notes and amber and red flags
- Worklists: ready for review, not responding, consultation needed
- Pre-op summary on screen and as a PDF

The patient

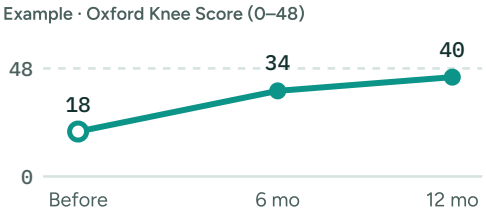

- Works on any phone, with no app or password
- One question per screen, saved automatically, pick up later
- SMS and email reminders on day 2 and day 5
- In Dutch, English, Turkish, Arabic, Polish and other languages
- For a next operation, earlier answers are already filled in

Your questionnaires, your rules

- Manage questions, logic and scores yourself, without programming
- Test cases check after every change that outcomes are still right
- Published versions are locked; a new version takes one click
- For the whole organisation or per location
- Translations side by side, with missing text highlighted

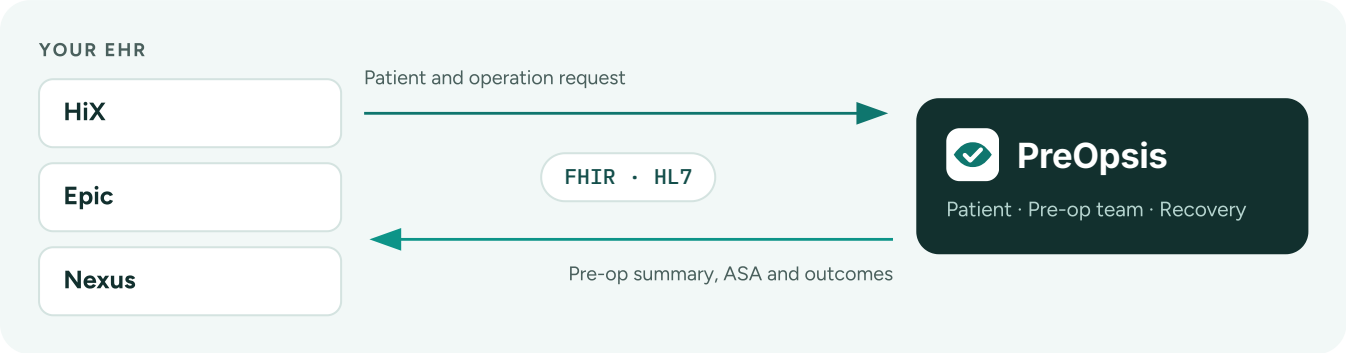

After surgery

- Recovery check at home, for example at 7 days and 6 weeks
- PROMs with a baseline: EQ-5D-5L, Oxford Hip and Knee Score, HOOS-PS and KOOS-PS
- Measurement points aligned with the LROI (Dutch arthroplasty register)
- A task for the team when a score drops
- Reporting per procedure

INTEGRATION AND SECURITY

Fits into your hospital

Connected to your EHR

- Integration with HiX, Epic and Nexus via FHIR and HL7, set up for each hospital
- Patients identified by BSN (citizen service number)
- Findings coded in SNOMED CT and ICD-10, ready to use in the EHR
- One environment for all your locations, with access set per location

Privacy and security

- Each hospital's data strictly separated
- Every view and change recorded in an exportable audit log
- Two-factor sign-in for all staff
- Encrypted in transit and at rest
- Data stored within the EU
- Data processing agreement under the GDPR (AVG)

How we start

1 Introduction
Together we map your current pre-op process.

2 Set-up
Your questionnaires, languages, rules and the link to your EHR.

3 Start with one specialty
Orthopaedics, for example, with a named contact.

4 Expand
To other specialties and locations, at your pace.

Book an introduction

Show us how your pre-op process works today. We'll show you where PreOpsis fits.
